What the color remembers

The icon is the current reading. The color groups a selected history and terrain context.
These are context names, not danger levels or category colors.

Color	History before this square	Current slope
RED	Last two dust readings: HAZE, HAZE	non-flat
BLUE	Last dust: HAZE; the one before was not HAZE	non-flat
AMBER	Last dust reading was not HAZE	non-flat
GREEN	Last two dust readings: HAZE, HAZE	flat
PURPLE	Last dust: HAZE; the one before was not HAZE	flat
PINK	Last dust reading was not HAZE	flat

RED HAZE: haze now, haze on both earlier squares, non-flat terrain now.
GREEN HAZE: the same recent haze pattern, but flat terrain now.
RED STORM / BLUE STORM: the same current storm, different earlier dust history.

The left box on paper and the stage card use exactly the same context function.
The right-hand word names a category observed in the next historical square.
Its ink repeats the matched context; it does not predict the next live color.

The stage mock is paused after square 06 has been revealed/crossed. Only its four cards are shown; older readings are stored. Voting selects a card in square 07.
The terrain used by the color is already known here. A reveal of hidden square 07 must not silently use its still-hidden slope to assign a new cue color.

Six colors compress selected features, not the entire map history. Different detailed histories may share a bucket. This is a hand-designed context key, not transformer attention or a claim about real Mars.
