FACILITATOR / A POSSIBLE THREE-SQUARE SEQUENCE

Full does not mean safe

WORKED EXAMPLE

1 / BATTERY	2 / SLOPE	3 / DUST	4 / GROUND
BLUE	AMBER	PURPLE	GREEN

01 / Current square: haze is the cue

02 / Next square: the storm is here

03 / Following square: the battery is dead

Read the paper, then choose what to reveal

Some sheets say **HAZE -> FULL / vote 1 BATTERY**.
Other sheets say **HAZE -> STORM / vote 3 DUST**.
Both observations are possible under the same model—even in the same historical case.

> **If the rep flips battery:** it is full in square 2. That does not clear the weather.
> **If the rep flips dust:** STORM is visible, so AVOID is justified.
> The battery is dead in square 3, immediately after the hazard. Recharge before moving on.

Sudden death makes both errors matter

GO into SAND or STORM: the run ends.
AVOID a safe square: the run also ends.
Move on a dead battery: the run ends. Recharge first.

Illustrated valid model sequence, not one of the four sealed routes.
In frozen Rover Run, battery also dies after SAND. The false-avoid death is new to this extension.
